

Docket No. 1928K US

IN THE CLAIMS:

WHAT IS CLAIMED IS:

5 1. (Previously Presented) A compression treatment system comprising:

 a first bladder supported about a limb;

 a second bladder supported about the limb, the bladders being in fluid communication with a fluid source and the
10 bladders being inflated such that the first bladder is inflated for a first time period and the second bladder is inflated for a second time period, the second time period and additional time periods being initiated within the first time period; and

 a pneumatic control circuit located at a controller housed
15 separately from the inflatable bladders, the pneumatic control circuit including the controller, a single pressure sensor, a single check valve, the fluid source and a plural of solenoid valves, the single pressure sensor located between the fluid source and solenoid valves and communicating with the first
20 bladder and the second bladder, and the single check valve operably connected to the fluid source and located between the fluid source and solenoid valves, wherein the single check valve prevents leakage out of the first bladder, and the single pressure sensor measures bladder pressure in cooperation with

Docket No. 1828K US

the controller to calculate venous refill time at the first bladder.

2. (Previously Presented) A compression treatment system as recited in claim 1, further comprising the controller that communicates with the pressurized fluid source and the pressure sensor, the controller being configured to monitor and regulate pressure in the bladders.

3. (Previously Presented) A compression treatment system as recited in claim 1, wherein the controller is disposed with the housing that is portable.

4. (Original) A compression treatment system as recited in claim 1, wherein the housing includes a plurality of ports connectable to a plurality of bladders.

5. (Previously Presented) A compression treatment system as recited in claim 4, wherein the single pressure sensor monitors pressure at each of the plurality of ports to determine if a bladder is connected thereto and sends a representative signal to the controller.

6. (Original) A compression treatment system as recited in claim 2, wherein the controller includes separate valves that regulate inflation of the bladders.

Docket No. 1020K US

7. (Cancelled)

8. (Previously Presented) A compression treatment system as recited in claim 1, wherein the pressure sensor is configured to monitor pressure of each of the bladders.

5 9. (Previously Presented) A compression treatment system as recited in claim 1, further comprising a foot bladder communicating with the pressure sensor.

10. (Previously Presented) A compression treatment system comprising:

10 a first bladder supported about a limb;

a second bladder supported about the limb, the first and second bladders being in fluid communication with a fluid source and the first and second bladders being inflated such that the first bladder is inflated for a first time period and the second
15 bladder is inflated for a second time period, the second time period being initiated within the first time period;

a third bladder supported about a foot, the third bladder being in fluid communication with the fluid source; and

a pneumatic control circuit located at a controller housed
20 separately from the inflatable bladders, the pneumatic control circuit including the controller, a single pressure sensor, a

Docket No. 1828K US

single check valve, the fluid source and a plurality of solenoid valves,

the single pressure sensor, located between the fluid source and solenoid valves, communicating with the bladders and the check valve operably connected to the fluid source and located between the fluid source and solenoid valves, wherein the single check valve prevents leakage out of a measuring bladder, the single pressure sensor measures bladder pressure in cooperation with the controller to calculate venous refill time at the measured bladder.

11. (Currently Amended) A compression treatment system as recited in claim 10, wherein the pressurized fluid source alternately inflates the bladders disposed about the limb and the bladder disposed about the foot.

12. (Currently Amended) A compression treatment system as recited in claim 10, further comprising a controller that communicates with the pressurized fluid source and the single pressure sensor ~~pressure transducer~~, the controller being configured to monitor and regulate pressure in the bladders.

13. (Original) A compression treatment system as recited in claim 11, wherein the controller is disposed with a housing that is portable.

Docket No. 1828K US

14. (Original) A compression treatment system as recited in claim 11, wherein the controller includes separate valves that regulate inflation of the bladders.

15. (Cancelled)

5 16. (Currently Amended) A compression treatment system as recited in claim 10, wherein the single pressure sensor ~~pressure transducer~~ is configured to monitor pressure of each of the bladders.

10 17. (Previously Presented) A compression treatment system comprising:

a first plurality of bladders supported about a first limb;

a second plurality of bladders supported about a second limb, the bladders being in fluid communication with a fluid source and the bladders being inflated such that:

15 a first bladder of the first plurality of bladders is inflated for a first time period and a second bladder of the first plurality of bladders is inflated for a second time period, the second time period being initiated within the first time period, and

20 a first bladder of the second plurality of bladders is inflated for a third time period and a second bladder of the

Docket No. 1828K US

second plurality of bladders is inflated for a fourth time period, the fourth time period being initiated within the third time period; and

5 a pneumatic control circuit located at a controller housed separately from the inflatable bladders, the pneumatic control circuit including the controller, a single pressure sensor, a single check valve, the fluid source and a plurality of solenoid valves,

10 the single pressure sensor, located between the fluid source and solenoid valves, communicating with the bladders and the check valve operably connected to the fluid source and located between the fluid source and solenoid valves, wherein the single check valve prevents leakage out of a measuring bladder, the single pressure sensor measures bladder pressure in
15 cooperation with the controller to calculate venous refill time at the measured bladder.

18. (Currently Amended) A compression treatment system as recited in claim 17, further comprising a controller that is disposed with a housing that is portable, the controller
20 communicating with the pressurized fluid source and the single pressure sensor ~~pressure transducer~~, the controller being configured to monitor and regulate pressure in the bladders.

Docket No. 1828K US

19. (Original) A compression treatment system as recited in claim 1, wherein the pressurized fluid source alternately inflates the bladders disposed about the first limb and the bladders disposed about the second limb.

5 20. (Currently Amended) A compression treatment system comprising:

a first plurality of bladders being supported about a first limb and a second plurality of bladders being supported about a second limb;

10 each bladder of the first plurality of bladders and the second plurality of bladders having a separate valve in communication therewith, the valves being in fluid communication with a fluid source and the bladders being inflated such that:

15 a first valve is open such that a first bladder of the first plurality of bladders is inflated for a first time period and a second valve is open such that a second bladder of the first plurality of bladders is inflated for a second time period, the second time period being initiated within the first time period, and a third valve is open such that a third bladder
20 of the first plurality is inflated for a third time period, the third time period being initiated within the second time period, and

Docket No. 1828K US

a fourth valve is open such that a first bladder of the second plurality of bladders is inflated for a fourth time period and a fifth valve is open such that a second bladder of the second plurality of bladders is inflated for a fifth time period, the fifth time period being initiated within the fourth time period, and a sixth valve is open such that a sixth bladder of the second plurality is inflated for a sixth time period, the sixth time period being initiated within the fifth time period;

a pneumatic control circuit located at a controller housed separately from the inflatable bladders, the pneumatic control circuit including the controller, a single pressure sensor, a single check valve, the fluid source and a plurality of solenoid valves,

the controller communicates with the pressurized fluid source and the single pressure sensor ~~pressure transducer~~, the controller being configured to monitor and regulate pressure in the bladders,

the single pressure sensor, located between the fluid source and solenoid valves, communicating with the bladders and the a check valve operably connected to the fluid source and located between the fluid source and solenoid valves, wherein the single check valve prevents leakage out of a measuring bladder, the single pressure sensor measures bladder pressure in

Docket No. 1828K US

cooperation with the controller to calculate venous refill time at the measured bladder.

21. (Cancelled)

22. (Cancelled)

5 23. (Cancelled)

24. (Cancelled)

25. (Cancelled)

10 26. (Currently Amended) A compression treatment system as recited in claim 1, wherein the check valve operates without an electrical signal to the a controller.

27. (Currently Amended) A compression treatment system as recited in claim 10, wherein the check valve operates without an electrical signal to the a controller.

15 28. (Currently Amended) A compression treatment system as recited in claim 17, wherein the check valve operates without an electrical signal to the a controller.

29. (Currently Amended) A compression treatment system as recited in claim 20, wherein the check valve operates without an electrical signal to a the controller.

Docket No. 1828K US

30. (Canceled) ~~A compression treatment system as
recited in claim 21, wherein the check valve operates without an
electrical signal to a controller.~~

31. (Canceled) ~~A compression treatment system as recited in
claim 25, wherein the check valve operates without an electrical
signal to a controller.~~

32. (Previously Presented) A compression treatment system
as recited in claim 17, wherein the measured bladder is selected
from a group comprising the first bladder, second bladder, third
bladder, and fourth bladder.
